

Tajima Industries Ltd

Company Description

Since development of the multi-head embroidery machine in 1964, Tajima Group has transformed the previously expensive embroidery into a more accessible commodity, bringing colors to people's lives all over the world.

At the same time, we are developing and improving the embroidery technology which we have developed to date to help realize a more prosperous society. We are developing decorative embroidery, which has been used mainly in the apparel industry, into functional embroidery and expanding its possibilities into interior, automotive, aerospace and space applications. We have also acquired a Canadian software company to the group, in order to establish an organization capable of providing both hardware and software solutions to changing market needs and manufacturing site issues.

Some of our customers have started their business with a single embroidery machine and have grown into multi-billion-dollar companies within a few years. As a manufacturing company, we are committed to working with our customers and the market and developing our technology day by day, so that we become a company that enables our customers to achieve success together.

"Surprising and inspiring customers around the world"

With this in mind, Tajima Group will continue to move forward into the future.
