

Cellid, Inc.

Company Description

Blending the Physical and Digital Worlds.

Ever since the inception of computers, mankind has evolved them to be smaller, lighter, and faster.

In the near future when AR glasses become widely adopted, the screen will go from 2D to 3D and as long as your eyes are open, you will be able to access the computer hands-free.

After that, computers will evolve to support humans even more, with technologies such as contact lenses and brain computing. There is a huge market where the world's top companies are leading the way and waving their flags.

We would like to be a company that can clear the high hurdles required for this evolution and lead this development at the top.

Company Details
