No permission to work in Japan required

Job Description

[About the Company]

The company is Japan's only comprehensive lock manufacturer whose main business is the design, manufacture, and sale of automotive locks, residential locks, locks for industrial equipment, and lockers.

Since its establishment in 1923, the company has provided products that constantly pursue "safety, security, and

convenience" as a lock manufacturer.

In its three business segments of automotive, housing, and locker systems, the company continues to produce top-quality products backed by its four core technologies (key & lock technology, decoration technology, layout configuration technology, and access control technology).

The company has created highly functional products such as electronic key systems for automobiles and homes, precision mechanical keys, and coin operated lockers. The company's strengths lie in a variety of technologies, including mold design using computer systems, die casting, resin molding, stamping, and other forming technologies, surface treatment technologies such as plating and painting, automatic trimming and precision processing technologies, and automated assembly technologies using robots. The latest key and keyless products produced by these unique technologies support people's safety, security, and comfortable life.

The various products related to locks that the company has been working on since its inception are not only based on "keys" but have evolved into "keyless" technology, where locks are opened by entering a PIN code or by remote control, through the introduction of the latest electronics technology.

At the headquarters located in Kanazawa-ku, Yokohama, the company designs and develops automotive parts (door handles, key sets, etc.), residential lock products, etc. From the design concept stage, they utilize CAE (engineering support computer) to analyze the strength and rigidity of single parts all the way through to the finished product, and for automotive parts, they perform mechanical analysis by applying crash conditions that take into account the vehicle system.
