募集要項

- Analyze and understand business requirements and use cases, and define software architecture to meet functional and non-functional requirements.
- Collaborate with stakeholders, including business users, product owners and developers, to identify and prioritize use cases and define the software architecture to support them.
- Designing the overall structure and components of a software system, including defining the various modules, their interactions, and the data flow between them.
- Create and maintain architectural documentation such as diagrams, system models, and design patterns to communicate architecture to development teams and other stakeholders.
- Identify and mitigate potential risks and issues related to software architecture, such as performance bottlenecks, scalability limitations, and security vulnerabilities.
- Collaborate with other architects and technical leads to integrate software systems with other systems and components to ensure seamless interoperability and data exchange.
- Create and maintain documentation such as technical specifications, system diagrams and user manuals to ensure knowledge transfer and facilitate system maintenance and upgrades.
- Analyze and understand the business requirements and use cases to define the software architecture that meets the functional and non-functional requirements.
